

## MeasureResults®

MeasureResults is a web-based solution for K-12 school district administrators who want to determine the needs for, and evaluate the effectiveness of products and services aimed at improving student results.

Increasingly, district decision makers—administrators, school boards, parent groups, and other leaders—are asking that their investments in instructional and professional development programs be justified with evidence of effectiveness. With MeasureResults, such evidence can easily and efficiently be made available from the district’s own data, increasing the capacity of existing research staff.

MeasureResults is not a data warehouse or testing application. Instead, it is a suite of tools that build on school and district databases already in place. MeasureResults allows users to conduct a study in three basic steps:

**Design Study:** District decision makers utilize the MeasureResults study planner to answer a series of questions regarding their setting, the program they want to evaluate, and the measures they want to use. These answers provide the basis for determining the appropriate design.

**Provide Data:** The user will be provided with a data request that outlines the data needed for the analysis; once completed they can securely upload the data through the MeasureResults system.

**View Reports:** Once the data is checked for completeness and accuracy, it is processed through our analytical engines and carefully reviewed by one of our statisticians. Within two weeks, a 2-3 page confidential report that clearly summarizes the study findings is provided for the user.

With MeasureResults, decision makers can make the most of a district’s investment in data tools and join a growing community of school district leaders who are learning from their shared experience.
